FOR IMMEDIATE RELEASE:

Ionit's Enterprise Management Software Gives You Complete Control

Demonstrating continued leadership in advanced compression technology, Ionit launches its Enterprise Management Software (EMS) at ASIS 2009, Booth 1712. Pleasing Security Directors and CIOs alike, Ionit's EMS gives enterprise users the ability to configure, back-up and restore all DVR settings from a central location. Features include a monitoring dashboard for at-a-glance viewing of hardware/software connection and health status; map creation for quick reference to live video and alerts playback and export to CD/USB; or playback video from any system on the network. Ionit's virtual matrix has camera drag and drop features for easy custom configuration of up to 128 cameras on 8 monitors.

"The ability to add any third party business intelligence software and an unprecedented opportunity to manage your video system makes Ionit the system of choice for enterprise users," says Jim Talbot, CEO, Ionit Technologies. In evidence of this capability, Ionit has teamed with a cutting edge data correlation provider to provide users specific and actionable intelligence from their video surveillance platform.

Ionit leads the industry in developing advanced compression technology and digital video management platforms. Ionit delivers superior quality video, at faster frame rates using a fraction of the bandwidth and storage required by others, while harnessing excess processor capacity to run third party applications i.e. video analytics and business intelligence software.
