

WHO WE ARE

DSA is a valuable resource for public and private organizations interested in understanding existing and emerging document and mobile security solutions. We draw upon our members' knowledge and technical disciplines to increase awareness of the problems associated with counterfeiting and identity theft.

DSA maintains a globally recognized controlled-access glossary of security features and their attributes, available exclusively to members and government entities.

Our annual three full-day technical meetings feature speakers from government, academia, and industry.

Our white papers cover topics such as the Real ID Act, Driver's Licenses, and Birth Certificates. We brief officials at the highest government levels, including legislators, federal and state government executives, and international organizations, and support government agencies in upgrading their documents and identity strategies.

WHERE WE STAND

DSA is committed to identifying threats to legitimately issued documents, their production, and issuance processes.

The pillars of our approach are:

- Improving the protection of our institutions and populace, but not at the expense of governing laws or the social liberties they protect.
- Maintaining a politically neutral position on proposed laws and the "conventional wisdom" of popular interpretations of those proposals.
- Counseling each side of any security debate to maintain an optimal balance of civil protection and civil liberty.
- Ensuring that the right level of document security and supporting systems are adopted to establish the optimal protection level for each application.

Be a part of an alliance of government, industry and academia dedicated to securing the production, issuance, and authentication of identity, credentials, and currency to combat:

- terrorism
- illegal immigration
- identity theft
- counterfeit currency
- contraband goods
- espionage
- human trafficking
- other criminal acts that benefit from the use of fraudulent documents and identity.

WHAT DSA DOES

DSA enlists participation from those who share our mission objectives in both the public and private sectors. We proactively build political and public awareness of current document security and identify trends that affect national security, both beneficial and detrimental.

DSA promotes proven document security technology and security-related training and procedures. We publish papers, participate in industry and government conferences, and provide support for information sharing, case histories, and membership concerns. We identify methods of improving security documents and related procedures, and we develop recommendations to improve the processes and procedures surrounding document security. Our members offer a wide range of technical disciplines and expertise to inform and educate the public and private sectors.

DSA unites members of the public and private sectors in a dynamic partnership to support research, define best practices, and disseminate information.
